

How to move a VM to another network

Move a VM to another network

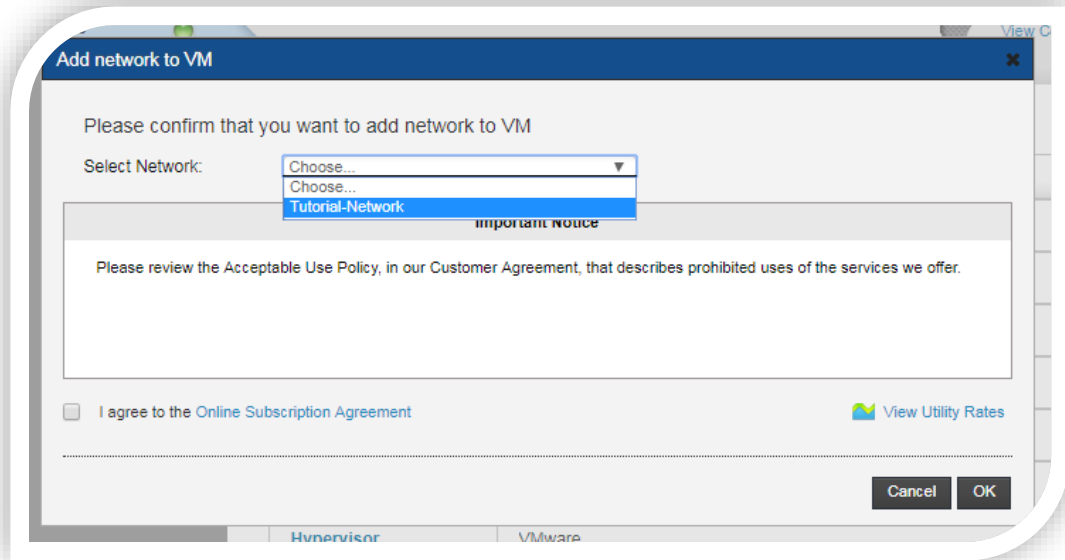

- We assume that a VM is already created and it belongs to the default network or to an existing network that you have created
- From the **GIOCloud Portal**, click on the **My Services** tab located on the top horizontal menu
- Click on **Manage Resources**
- Go to the **Instances** tab

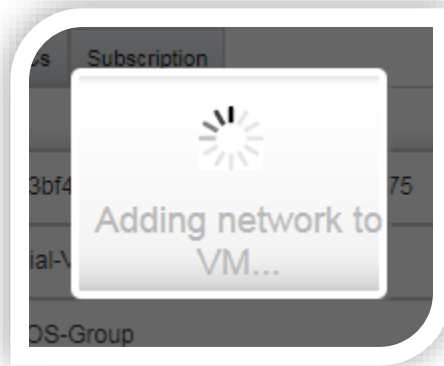

- Select the VM which you want to move to another network on the **left vertical** menu
- Click on the **gear icon** and select **Add Network to VM**

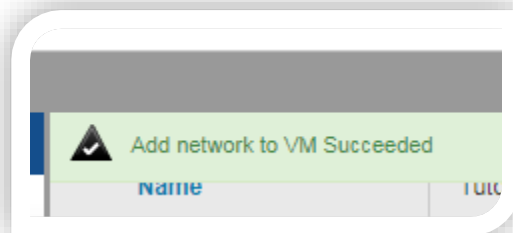

- Choose the network that you want to move your VM to, and check on **I Agree to the Online Subscription Agreement**, then click on **OK**

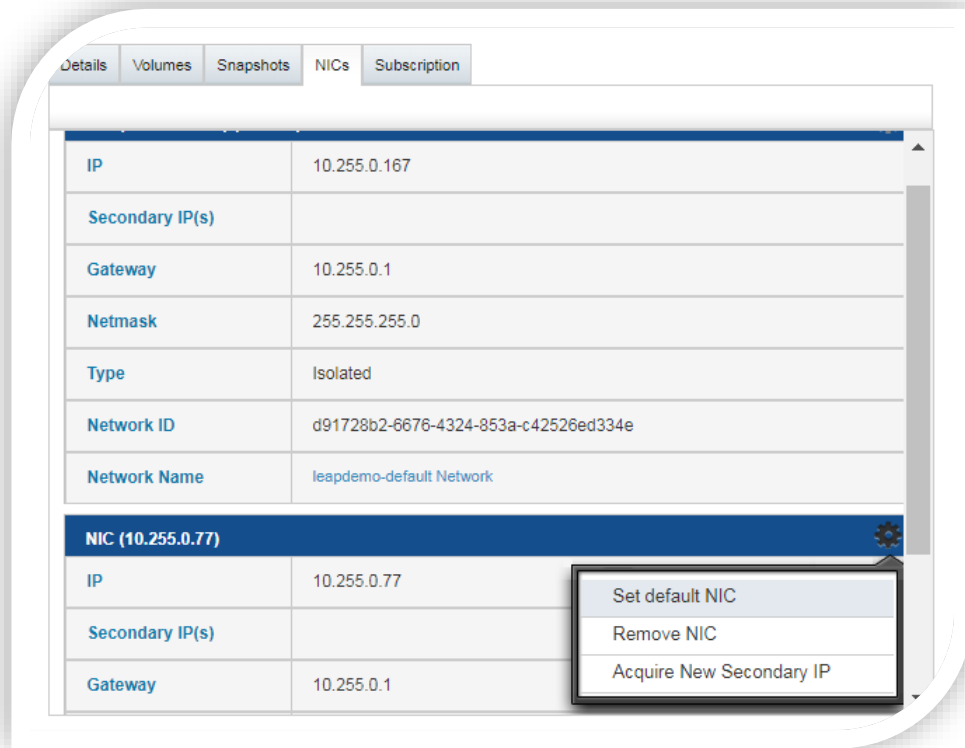

- Wait for the Network to be added to the VM

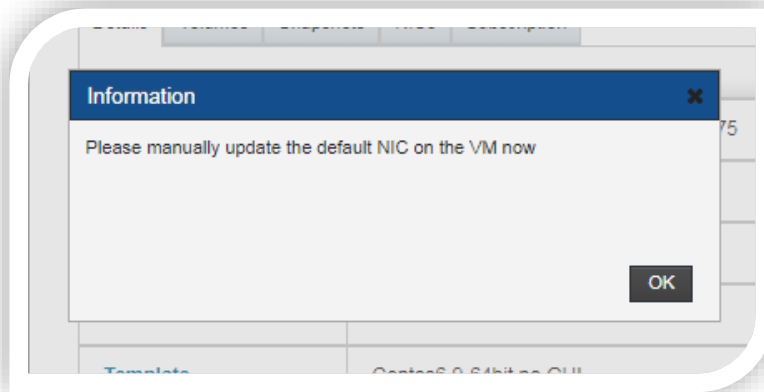

- Once added, a message will appear in green

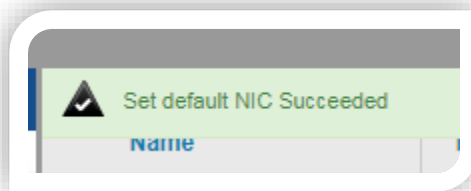

- Make sure that the VM is still selected and click on the **NICs** tab of the VM
- Click on the **gear icon** of the second NIC and select **Set Default NIC**

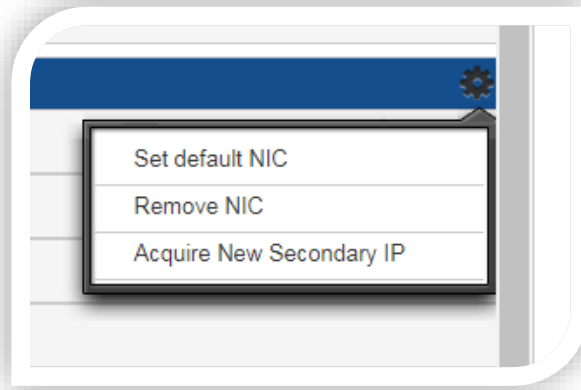

- The following message will appear and click on **OK**. We will take care of this step by stopping then starting the VM

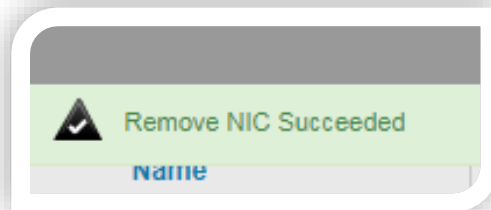

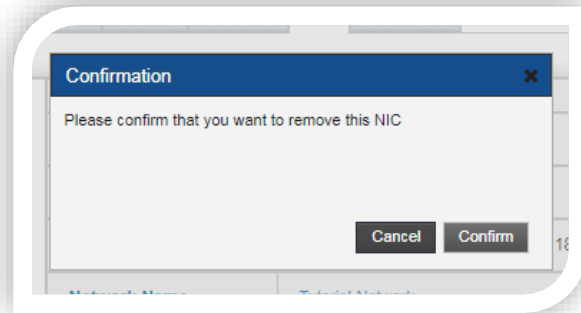

- Once the second NIC is set as the default NIC, a green message will appear

- Make sure the VM is still selected and **STOP/START** the VM. Do **NOT** reboot the VM. This step is to make sure the VM and the network will communicate correctly with the GIOCloud Portal
- Once the VM has started, test your network and make sure **everything works correctly with the new network**. After all tests are **successfully** completed, you can remove the former network by following the below step
- Go to the **Instances** tab, select the VM, click on the **NICs** tab of the VM, click on the **gear icon** of the second NIC (former first NIC), and select **Remove NIC**

- Click on **Confirm**
